To Whom It May Concern,

As an Internist and an avid distance runner, I see a variety of athletic patients who suffer from joint and muscle pain that are unable to use NSAIDS and other traditional remedies due to gastrointestinal issues associated with taking these drugs. Therefore, I am always looking for alternative ways to treat this patient population that will allow them to continue their active lifestyle, while relieving the sprains and strains that many of them face on a daily basis. I have recently found the topical pain creams compounded by BioMed Specialty Pharmacy to be very effective for this group of patients. Topical pain compounds offer patients an alternative to oral medications by treating pain at the source and lowering the possibility of adverse drug interactions thereby producing fewer side effects. By delivering medication directly to pain receptors, I have seen great improvement in many of my patients suffering from various conditions that have previously been difficult to treat.

BioMed's Compounds have also been very beneficial in my own life as I recently used Formula #7 during my training and participation in the Detroit Free Press Marathon this past fall. By using the topical creams, I was able to run 26.2 miles with very little pain and discomfort.

I would recommend the use of BioMed's topical pain compounds for anyone in need of Pain relief that cannot tolerate the use of NSAIDS or who do not want to subject their entire body to oral medications and the side effects associated with their use.

Sincerely,

Julie L. Price, MD
